Ccleaner for apple ipad

March 15 07:51 By Daniel Ionescu, PCWorld reviews apple's new iPad, critics say the high-resolution display of the dong, better camera, 4G LTE connection and bumped-up specs help the iPad retain the title of the best tablet on the market. Reviewers had a week to test the iPad before going on sale, and they picked apart all the features. The new iPad looks almost identical to the iPad 2, Jason Snell notes in his MacWorld review. He says the extra thickness of the new model is barely noticeable, but the 50 grams gained from the addition are said to stand out. Once you get loads of those retina displays, it's hard to move back to something else. Snell writes, but users of iPad 2 shouldn't be afraid: their iPad investment is definitely good for other years. Since its launch in 2010, the iPad has been the best tablet on the planet, says Walt Mossberg in his review of Everything D, a new third-generation model that still holds the crown, and recommended the new iPad as the best choice on a universal tablet. Mossberg didn't find any noticeable weight gain even for long reading or video viewing sessions, as for retina displays, his epiphany came when I placed my iPad 2 next to the new model 2, with the same text on the screen. The letters and words that seemed sharp in the previous model five minutes ago suddenly seemed blurry. New iPad: Read macworld reviews The new iPad doesn't introduce anything we've seen before, from iPhones or rival tablets, David Fogg notes in his New York Times review. Apple just had a white hot iPad to add the latest screen, battery and cellular technology. Pogue is now still looking better, better integrated and more consistently designed than its competitors, for the same price as before, and you can get an updated iPad. He thinks a 10-inch tablet with a rear camera is a ridiculous idea, but Joshua Topolski remarked in his review on the verge that an improved camera on the new iPad would actually produce pretty favorable results. Thanks to the improved sensor, photos taken on the iPad now seem relatively respectable, and the depth of view is shallow, which allows you to pull out artistically visible images. Topolski said he likes the new iPad and that it's the most functional, usable and beautiful tablet any company has ever produced. Jim Dalrymple went beyond specs in his new iPad review for Loop, saying, no one in the market today can touch the Apple experience. His highlights include seamless iCloud sync and Ray Air Play on Apple TV, of course, high-resolution displays, which will make you take it twice the first time you see it. Even on the home screen, it's crisp and clear - you can even notice a big difference in iPad 2. ▼ John Gruber in his bold fireball review at the 64GB AT&T in downtown San Francisco Read more about testing the T-4G lite ▼ iPad. He found the performance easy. With fast, perceptual, rock solid Wi-Fi connections. Battery life was robust: Two hours after web and e-mail on LTE, battery life was still being measured at more than 80% capacity. What is not to love? It's simple, Gruber concludes. At Tech Crunch, MG Ziegler was very passionate about the new iPad in his review: the technology is amazing, this new iPad is amazing. Also surprising: the only company competing with Apple right now in this particular space is Apple. If you don't have an iPad yet, you can get a new one. He advises. If you're a tablet novice, there's no better choice on the market than the iPad on offer - and if this is pretty big - the price won't be a problem if you don't want a tablet that fits in your pocket, such as the \$199 Amazon Kindle Fire, which is advice coming from Ed Weig in his USA Today review, noted by the lack of flash, noted by the lack of SD, as a lack of flash. It's hard to find many negatives among the first new iPad reviews, and it seems Vincent Nguyen nailed it in his review of Slash Gear: Apple doesn't need another revolution, it has already launched one, and the new iPad undoubtedly gives a fresh degree of refinement to wangssegment. Are you getting a new iPad, obsessed with iPad 2 now, or considering an Android tablet? I hear a sound in the comments. For more information, see the Affiliate Link Policy. March 16 06:50 By Daniel Ionescu, PCWorld Packs a much larger battery on the new Pad, which is available on general sale today, to juice the tablet for up to 10 hours, with a 4G LTE connection. New iPad tears. Source: iFixit The latest 4G LTE-connected chip is best known for sucking up battery life faster than apps can be downloaded, but it won't fly with the iPad, which Apple touts as providing 10 hours of battery life, and competitors have found it difficult to match. The third-generation iPad is no exception to the 10-hour rule, even in 4G, and Apple's secret recipe for this was ripped off by the iFixit crew. The new iPad has a 42.5-5-y battery compared to the 25-th lithium-ion battery found on the iPad 2. Inside, the new iPad is basically a huge battery, electronics neatly arranged around the sides. The larger battery is 3.7 volts and carries about 10 hours (nine on the cellular data network), similar to the battery on the iPad 2. An additional 17.5 watt hours will be used to power the extra RAM (1GB) and improved graphics chips. Larger batteries and high-resolution retina displays have taken a toll on the thickness and weight of the new iPad, but it's thicker than half a millimeter thicker. 2 (reviewers are inconspicuous) and 50 grams heavy. Chris Pozman from ArsTechnica calculates that Apple has increased battery capacity by 70% with the new iPad, but the tablet is also 70% larger. Read more March 15 10:38 By Melissa J. Ferenson, PCWorld 3G Apple iPad is here, we've tested next to our best Android tablets - Asus Transformers Prime TF201 and Samsung Galaxy Tab 10.1. Although our testing of battery life and charging time is still pending, a clear picture of this latest iPad is emerging. In a nutshell: The new iPad stripes on the head of the pack, mainly on the strength of the display improvements. However, this does not mean that others will have to give up racing. It just means that they're going to have to work harder to overcome the iPad's lead. In comparison I'm going to make here, I'm focusing on the new iPad, the old iPad 2, three recently high-ranking 10.1-inch Android challengers: Asus Eee Pad Transformer Prime TF201, Samsung Galaxy Tab 10.1 (for this review, we tested the 4G LTE version), and the Toshiba Exit 10 LE (formerly known as X1). And one is so new that it is still making its way through our tests. Here all three Android models have a resolution of 1280 x 800 pixels, which means that their inches per pixel specification will beat that of the iPad 2 2, 150 ppi to 132 ppi. For its part, the new iPad is a gorgeous pack, with a high-resolution Retina display 2048 x 1536 pixels, yielding a whopping 264 ppi--and yes, that pixel difference. Big difference. I've already compared that new iPad's specs of Android mass, identifying where it's outstanding and where it stumbles a little (i.e. physical size and weight). This time, the spotlight is on actual performance. Read more March 15 02:45 Apple's new iPad is in stock online, so the only way to get one on launch day is to brave iLines. This allows you to get up early, pray for good weather, huddle for hours with strangers and have the latest gadgets ahead of others. Still interested? Getting a new iPad on Friday won't be easy, but it can be. Here's what you need to know before you walk out the door: The new iPad has retina display with four times as many pixels as the iPad 2. Its A5X chip has the same dual-core processor as its predecessor, but it's got a quad-core graphics processor and, according to reports, 1GB of RAM. The rear camera is now 5 megapixels and features image stabilization, face detection and autofocus. Read more March 16 08:18 If you're using an iPad - the original model or iPad 2 - for a while, you're well aware of the arred accessories out there. But if the new iPad you're shipping today is your first, you might be wondering about the best accessories and add-ons. We cover these products regularly, so we have a good amount of experience here. The good news is that because the new iPad is almost identical to the iPad2, a market already flush with compatible accessories. The bad news is that there are so many options that you don't know where to start for the same reason. Here's a quick list of the most useful iPad accessories, some of the recommendations for each type, and links to a comprehensive buying guide for more information. The most popular iPad accessory, the good case keeps your iPad safe while traveling and protects it from accidental scratches and drops while in use. Some cases include built-in stands to make it easier to watch videos or view hands-free photos. But beyond these basics, cases vary widely. Read more March 14 06:22 The iPad has been an amazing success story. Apple sold 15 million of the original models in the first nine months the product existed, a number that blew even the most optimistic prognosis. With the introduction of the iPad2 last year, things kept accelerating. In less than two years, Apple has sold nearly 60 million iPads to dominate the market. Keeping Apple's lead on tablet devices is the work of the third-generation iPad, a product that doesn't mess with success. Like the iPad 2 before that, this new iPad is not a re-idea of the original concept. Instead, Apple chose to focus on some areas of improvement while keeping the entire package the same. It's an approach that can frustrate people who are disappointed that it's not a quantum leap, but Apple can execute it perfectly and reap the rewards. In my review of the iPad 2, I suggested the rules of apple product evolution are the law of jobs - that the latest version of any Apple product is likely to be thinner and lighter than before. The 3G iPad violates that law. It's actually a bit thicker and slightly heavier than the iPad 2, and in many cases users don't recognize it faster. But the change Apple has made with this iPad is not about making it thinner, lighter or faster, it's about making things better. And on almost every front, the 3G iPad is significantly better than before. More power? Kind of. The iPad 2 is much faster than the original iPad, thanks to the dual-core A5 processor. However, the A5X processor that powers the third generation iPad does not offer more processing power than its previous model. In all our processor-based tests, the new iPad runs as fast as the iPad2. (That's not to say it's slow - it's the two fastest iOS devices.) With this update, Apple was not concerned about boosting the speed of the iPad, because it was another, bigger problem to solve: boosting the iPad's graphics capabilities so it could update 3.1 million pixels on retina displays. (As you should mind, the previous iPad screen had only about 786,000 pixels.) Updating many pixels requires much more graphics power to run as smoothly as before. Powered by the X Factor of the A5X processor, a new quad-core graphics engine. And certainly, the 3G iPad blows up all other iOS devices in terms of graphics performance. Using the GLBench 3D graphics test app, the third-generation iPad in testing can draw complex 3D scenes at a display full frame rate of 60 frames per second without breaking a sweat. And in GLBench off-screen testing, it is not limited by the display's frame rate, the third-generation iPad had a frame rate of 1.6 times that of the iPad 2 (and 13 times that of the original iPad). The photo-perfect original iPad had no camera. iPad 2 has added a video chat with enough resolution to shoot 720p video and a low-resolution front camera for the rear camera. Its rear camera, to put it blunt, was not very good. It was the weakest feature of the iPad 2, in fact. The good news is, with the 3G iPad, Apple is finally right to fault this. Apple's old brand name (just as it does when an old iBook laptop becomes the new iBooks app) applies as a label to that camera: iSight. iSight obviously means a camera that's good enough to take photos and videos with your camera. And it is. It's a 5 megapixel camera, not quite on par with the one on the iPhone 4S, but still very good. Compared to test images taken on other mobile devices from the new iSight camera on the new iPad, I found that the camera on the new iPad went pretty well. It offers almost the same image quality as the iPhone 4S and Asus Transformer Prime, clearly off both the Samsung Galaxy 10.1 and iPad 2. It seems safe to say that the new iPad has the best camera of all tablet devices, among the best of all mobile devices. Some of the full resolution images on three different Apple devices. For a company that likes to keep things simple to buy options, Apple has offered a whole bunch of options when it comes to buying an iPad. Like the iPad, the 2 and 3 generation models are available in 18 different varieties. You can choose: 16GB (\$499), 32GB (\$599), or 64GB (\$699) onboard storage white or black bezel (no price difference) Wi-Fi only, or AT&T&#amp; Most users in the past with Wi-Fi Plus Cellular (\$130 added) to T, or Wi-Fi Plus Cellular to Verizon (\$130 added) to Verizon, I've been to most of Ve've. The app, updated to include retina-level graphics, is a balloon in size. HD video files are huge. Those iBooks improved textbooks are huge. And if you shoot a 5 megapixel image and a 1080p video, you will fill the storage space left in a hurry. I still think most buyers should start with the assumption that they only need 16GB, but they need to ask their own some questions. Anyone who wants to load a lot of HD movies, shoot or install videos Many apps need to seriously consider larger capacity. But many people just don't use an iPad like that, and for them, 16GB will be fine. Read more March 15 06:00 Apple won't play discount games. The company focuses on creating the products people want and prices high enough to ensure healthy returns. Over the past few years, the strategy has worked brilliantly, as millions of consumers are willing to empty their wallets to acquire expensive MacBook E laptops, iPads, etc. we wonder, though: Can the new iPad break Apple's winning streak? After all, the third-generation iPad, though loved, is more of an incremental improvement than the full-fledged overhaul of its predecessor. Given that the top-of-the-line new iPad with 64GB and 4G LTE wireless runs \$829, Apple can test the resolve (and budget) of its deepest pocket fans. If you are itching to spend all your dough, we wouldn't want to discourage you: The recovery in the U.S. economy could use all the positive signs of consumer confidence. However, it's a good place to bear a few alternative purchases before whipping up your credit card. Here are some of the things you can buy for about \$829 (not tax included): Read more March 15 03:45 by Jeff Bertolucci, PCWorld crowd of tech enthusiasts, hoping to buy a new iPad on the first day of release, will likely withstand a long line at the Apple Store on Friday. And after unboxing objects of their desire, they'll immediately seek an app that exploits the tablet's dazzling retina display, with a resolution of 2048 by 1536 pixels. Well, there's good news: New iPad buyers will find a small but interesting assortment of retina-ready iPad apps in Apple's iTunes store, listing nearly two dozen apps already optimized for the tablet's high res display. Here are some notable choices: Sketchbook Pro for iPad Read more March 16 09:21 By Rob Griffiths, If MacWorld ordered a new iPad, you might be wondering what to do with your old one. Of course, one option is to pass it on to friends or relatives. Another option, though (as Rex Friedman points out in his guide to the scrapping of old iPads), is to sell old devices for cold hard cash - or at least gift cards or two. I took a look at nine such buyers, assorted iPads and 2 models getting price quotes for iPads. Before diving, you should know that the value of the iPad used is very volatile, depending not only on the condition of the machine, but also on market demand. The price I found was current on the morning of March 15, 2012, but depending on market conditions, it's very likely to vary when reading this. But they must give you ideas about what is possible. I priced all variants of all iPad 2s with the first generation iPad (WiFi and 3G versions of 16GB, 32GB, 64GB models): I only priced the black model. A few of these buyers distinguish black and white. I also got the price for an iPad in top condition. So if your tablet is scratched, dinged, or engraved, you won't get the best offer. When you sell an old iPad, you typically have to choose between receiving a gift card or cash. Gift card values are (usually) higher than cash, but gift cards are not very good if you want to use your money elsewhere than the vendor you're selling. NextWorth.com and Gazelle.com offer both a gift card (each a target card) and a cash option. In addition, GameStop's gift cards are worth 20% more than the cash value shown on the table. See more
